The present invention relates generally to food processing equipment and in particular to a multi-functional food processor with the ability to also serve as an extruder. In order to process food, one or a combination of functions is normally carried out. Various individual functions can be performed in a single machine, but the process becomes more complex as the number of functions are increased. In any event, a number of functions remain, including mixing, chopping, cutting, kneading, crushing, granulating, melting, and forming. Food processors are known in the art. One such food processor is disclosed in U.S. Pat. No. 4,501,593 (Carnahan) and is provided with a plurality of rotating blades to crush particles and an impeller to mix a food material. Carnahan also discloses the use of either a pair of uncoated steel wheels or a pair of sponge rollers in conjunction with the rotating blades to crush the particles. As disclosed, the food material is fed axially into one end of a housing having a pair of rotating whetted stainless steel parts. Some extruders have been designed to extract a liquid in the extruded food material and to massage the food material. U.S. Pat. No. 5,613,819 (Ingersoll) discloses a meat grinder that has an extruder for processing meat. The extruder is adapted to receive meat from a hopper and advance it through a path of reduced cross section. One wall of the path has an inlet for receiving meat from the hopper and terminates in a constriction which serves to prevent the meat from reentering the hopper. The constriction includes a surface having a plurality of recesses. The recesses serve to cause the meat to disintegrate when pressed into the recesses. A plurality of female blades are spaced about the path to form a screen section within the path, with the screen section having a peripheral wall that includes a plurality of apertures. The apertures allow meat to pass into the screen section without becoming jammed. Food processors for the general type disclosed in Carnahan have been provided with food extruders such as those disclosed in U.S. Pat. Nos. 5,299,548 (Rousselot) and 5,375,897 (Rousselot). Ingersoll is of interest in that it does have an extruder and the liquid is applied to the food material. It would be desirable to be able to

using System; using System.Collections.Generic; using System.Linq; using System.Threading.Tasks; using Microsoft.AspNetCore.Mvc; namespace AspNetCoreExample.Controllers { public class HomeController : Controller { public IActionResult Index() { return View(); } public IActionResult About() { ViewData["Message"] = "Your application description page."; return View(); } public IActionResult Contact() { ViewData["Message"] = "Your contact page."; return View(); } } } Q: What is this syntax? Ruby - STDOUT.read I am reading the ruby book and there is one piece that confuses me. STDOUT.read(n) Is the code intended to read n bytes of output until the end of STDOUT? What is the idea behind doing something like this? A: This is just a slightly shorter way to read from STDOUT. A common idiom is to use read() to read from STDOUT: n = STDOUT.read(1024) This would read 1024 characters from STDOUT. Another common idiom is to read from a file opened for binary (or just not at all, if not a binary file): n = File.read(STDIN) The semantics are the same in this case, but there is no need to open the file. Q: How can the intercepting variable be greater than the observed variable in a Poisson regression? I have three variables: -L1: number of people with heart disease -L2: number of people who quit smoking after heart
