Is it necessarily true that $|\mathcal L|$ is a countable infinity, even if the lattice is infinite? I'm having trouble seeing why it should be, and I don't know of any counterexample. A theorem of D.F. Brule in "The lattice of subsets of a finite set" (1932) says that a lattice is

That being said, I don't think there is any good reason to prove anything about the "infinity" of a lattice. I can't think of an example of a lattice with countably many elements that wasn't first-order definable. (I'm sure there are counterexamples if you start with a non-first-order theory.)
