Swifty Xena Pro can extract uncompressed SWF files from executables. Extracted files will be saved in EXE files directory. A backup file with the appended extension BAK will be created (in the same directory again) on replace operations. Both the backup file and SWF will be overwritten if they exist. Replacement can only be done if the new SWF filesize is smaller or equal to the old SWF filesize. Swifty Xena Pro reads file definitions from file "types.ini", that means it can be extended easily for simple file types. This version will not extract SWF files version 5 and above (with the supplied "types.ini" file). The version that is displayed is as read from the types.ini file. DIR/DXR format (at least the header) is not changed for D7 and, so, D6 files are also displayed as version 7. The filesizes displayed for DIR/CST files are not the actual filesize. They're true sizes for the DIR/CST file. Extracted filesize always equals the projector EXE size. Doubleclicking a CST/DIR file runs the file with Director. Since DIR/CST files are protected, Director will complain about this and won't open the file. I found this tool on the internet and I have found it does a good job. I am a graphics designer and I often use that tool to extract files so I can use them for my apps and use it in Flash Builder. Migration is a common phenomenon in China. Existing literature suggests that migrants living away from their hometowns have a decreased level of physical activity, when compared with their rural counterparts. Although previous literature has examined the determinants of physical activity among rural-urban migrant workers, fewer studies have been conducted to examine the determinants of physical activity among them. This study uses data from the 2008 Chinese Rural-Urban Migrant Workers Survey, a national representative sample of 3,863 rural-urban migrant workers. Using multivariate logistic regression analysis, the study examined the role of life satisfaction and social support in predicting physical activity among migrant workers. In general, migrant workers in China have a lower level of physical activity when compared with their rural counterparts. To our knowledge, our study is the first to empirically examine the factors associated with physical activity among rural-urban migrant workers in China. Our findings suggest that, among rural-urban migrant workers, physical activity is a function of life satisfaction and social support. We find that life satisfaction is negatively associated with physical activity, while social support is positively associated with physical activity. Migrants with lower life satisfaction are less likely to participate in physical activity. Meanwhile, those who receive more social support are more likely to participate in physical activity. Although the direction of our findings is consistent with previous literature, the significance of these findings should be interpreted with caution due to the cross-sectional nature of the data. Policy implications are also discussed.Q: Tuning Phosphorus Level and Growth of Phytoplankton Phosphorus (P) is a critical element for chlorophyll production and hence for phytop
