A: 538A28228E looks like an offset to the first address of the. 5FA00C202, from the address range B7F000 to B7FFFF gives an offset of 4FF0. So the value is stored at an address somewhere in the sector between B7F000 to B7FFFF. Since I don't have the paper, I cannot determine if those values are correct. So it is possible that the bit that you need to extract is not in the sector but in a sector that is located between the start address and the first address in that sector. Try to extract a sector of just one address and work from there. If you are lucky, the sector is in the first address and the bit you need is zero. If you are not lucky, you have to extract a sector that contains the correct bit, and you have to combine the results to get the right value. One convenient way to extract a sector of one address is to use the -b switch of dd. According to How to erase Sector: The sector size on floppy drives was 512 bytes, but is usually still specified as 512 bytes when used with Linux and Unix utilities. SSD's and most modern hard drives are generally used in sectors of 512 or 1K bytes. Writing 0 using dd will actually write the entire sector to the floppy disk, and of course, no sectors can be read, or even written, if no data is in that sector.
