

Historic Geology and Stratigraphy of India by Dr. Ravindra Kumar (txt) or view presentation slides on the Internet. Now is the time to use the available opportunities and get the necessary amount of knowledge in a very convenient and accessible form. At our seminar, we will once again dwell on several important issues: 1. What is petrography? 2. Where does the name of the mineral come from? 3. What are the main indicators of the mineral can be determined using petrographic analysis? 4. What is the basis for the qualitative and quantitative analysis of rocks? 5. What makes it possible to determine a solid solution? 6. How do rocks form in the soil? 7. How does the formation of rocks of the earth's crust? As a result of the seminar, its participants will be able to: - learn a lot about limestone, dolomite, granite, shale, basalt, sandstone, granite and other rocks; - gain knowledge about the

structure and history of the formation of the earth's crust, which will allow further study of the geology of the native land; What to expect at the seminar: Lesson 1: Introduction to petrography In this lesson, we will get acquainted with minerals, their crystal structure and properties. For example, we will find out which mineral is called halite and under what conditions it is formed in nature, why halite is used, what role halogen elements play in the earth's crust and its constituent rocks. At the end of the lesson, you will learn what petrophysical studies of rocks are and how quantitative and qualitative indicators of rocks are determined. The main objectives of the lesson: To develop ideas about the structures and structure of rocks, which will help to penetrate deeper into the essence of petrography; To develop the ability to understand the main petrographic indicators, designate the main minerals according to their main feature, compare them and draw conclusions. Subject: Description of mineral groups. The group of mineral compounds is the

structure, basic properties, composition and formula of complex compounds that form rocks. THEME: What minerals borders and forms their compounds, what are their physical and chemical properties? Synonym: Denotes: Kranz Erlandswerda A set of minerals similar in their structure, structure and formula of their compounds, as well as in their physico-chemical properties, is called minerals, in contrast to minerals belonging to different mineral species. Mineral type can be
