The friendly Net Watcher application allows you to track users access and files opened on your computer via the network. And it is friendly software, because after installation, you will not see any additional windows on your desktop, it is running in a new application tray icon (alias to tray icon), which can easily be removed. There is no need to hide it and move it into other app tray icons. It can be made to popup, when someone connects to your computer, if you enable this option. The program automatically kicks users automatically and manually. It can also log information about users. It is possible to play an audio warning, if someone accesses or opens a file on your computer. Questions and Answers: - What is the difference between the free version and the full version? The difference is that you can access the free version only one time per day. The full version gives you access to the function unlimited times per day. - How can I install the new version? You can download the new version by clicking on the link below. - Can I make it pop up? Yes, it is easy. Enable the check box "show the notification message", then after the user logs on, click on "ok". The notification message can be played, when the user accesses a file or opens a file. - Can I find out who uses my PC? You can find out who uses your PC, because when someone uses it, the application will kick him. You can do this by the following steps: - Go to menu "Settings" - Select the tab "Advanced" - Select the button "Log" - Under the title "To log" enter the email address, which you want to receive the log. - Under the title "To log" check the box "log IP" - Save the settings - Do I need a firewall? Yes, you will need a firewall, because the application runs in the background. You can turn off the firewall in the "Settings" tab. The firewall is configured by default. - What can I do with the log? With the log you can view the information and kick the user. You can view the information in a file, which is saved in the default folder. - Does the application use any resources? Yes, it uses 4MB of RAM (version 1.0) and 2MB of RAM (

KEYMACRO is a password cracking program that simulates cracking passwords. The password cracking speed depends on computer processor speed and running time. The faster the processor, the faster the cracking speed. The Password Cracking Simulator provides most of the same functions as the OpenCrack Password Cracking Simulator, with the exception that the Password Cracking Simulator does not use brute force (it does not try millions of different passwords). Instead, it uses a specific password-cracking algorithm, which is executed in a fully-interactive way, simulating a real-time attack to your target password. Password Cracking Simulator Crack Features: - Insert your target password; - Specify the number of times to check your target password; - Select the algorithm to use for cracking your password; - Press Start and watch the Attack. After the attack completes, a report showing the number of attempts and the number of different passwords that were tried is automatically printed. Password Cracking Simulator Version History: 19.4.1: Updated to version 19.4.1, minor bug fixes. 19.3.3: Updated to version 19.3.3, minor bug fixes. 19.2.1: Updated to version 19.2.1, minor bug fixes. 19.2: Updated to version 19.2, minor bug fixes. 19.1: Updated to version 19.1, minor bug fixes. 19.0.2: Updated to version 19.0.2, minor bug fixes. 19.0.1: Updated to version 19.0.1, minor bug fixes. 19.0: Updated to version 19.0, minor bug fixes. 14.10.2: Updated to version 14.10.2, minor bug fixes. 14.10.1: Updated to version 14.10.1, minor bug fixes. 14.10: Updated to version 14.10, minor bug fixes. 12.05: Updated to version 12.05, minor bug fixes. 12.04: Updated to version 12.04, minor bug fixes. 12.03: Updated to version 12.03, minor bug fixes. 12.02: Updated to version 12.02, minor bug fixes. 12.01: Updated to version 12.01, minor bug fixes. 12.00: Updated to version 12.00, minor bug fixes. 11.10: Updated to version 11 77a5ca646e

The program is very easy to use. The main window includes buttons for tracking the access to your computer network resources, the user manual and FAQ. Every time a user accesses or opens a file on your computer, the program launches an applet and starts logging information about the file access. The application also has an option to save a log file to the disk and to play an audio warning when a file has been opened. All of the tracked accesses are grouped together in a directory tree. To view a directory or an access to the file, a user clicks on the directory or the file name. The application allows to access to a lot of options for the kicking the user. You can: - Kick users automatically if they access or open a file on your computer too many times. You can configure which users should be kicked automatically or manually. - Kick users automatically if they open too many files or access too many resources on your computer. - Kick a user manually when you notice that a user is accessing a file or another resource on your computer or when he/she logged in to your computer and did nothing. - Kick a user manually if you detect that someone is accessing the files on your computer from another computer on your local network. - You can configure how long users can be kicked. - You can configure the time interval to kick users automatically. The program has the ability to log and automatically kick users when they try to access files from a remote computer on your local network. Every time a file has been opened or accessed, an applet is launched to log the information. The application has a built-in application for the audio warnings, which can be played by clicking on the "Play Audio" button. The built-in audio warning application allows to play 3 sounds at the same time. You can choose which types of files to be monitored or to play an audio warning for them. You can block the file accesses and show the list of blocked file names to the users who can open them again. The application is flexible and configurable, which allows you to configure it according to your requirements. The program is very easy to use. How to run Friendly Net Watcher: To run the application click the "Run now" button on the main window. To change the configuration of the application click "Options" button on the main window. To close the application click on
