In addition, the company can seek redress for patent infringement by companies that turn to the Patent Trial and Appeal Board (PTAB) to invalidate J&J's patents. In fact, J&J has filed more patent infringement lawsuits in U.S. courts than any other pharmaceutical company, according to an analysis conducted by Bloomberg News. But ultimately, an arrangement of this sort can be challenged by third parties who argue that it is in their economic interests to short-circuit patent licensing deals. In recent months, for example, Eli Lilly, which has made substantial investments in the development of a J&J drug, has sought to persuade the PTAB that a J&J patent on a pair of obesity drugs is invalid. Pfizer, which also holds a J&J patent, has lodged similar complaints. These lawsuits raise issues not only about intellectual property, but also about patient safety and access to medicine. Both Eli Lilly and Pfizer have argued that by creating the possibility of patent short circuits, J&J is discouraging the development of generic alternatives to its drugs. J&J contends, and the PTAB has found, that J&J's software programs are necessary to prevent "trolls" from buying J&J patents and then going after competitors that use the same technology. J&J can also prevent unsafe companies from developing new forms of drugs that could affect the safety or efficacy of its products. In February 2017, for example, a company called LivaNova announced that it planned to develop a cheap version of an anti-cancer drug called imatinib mesylate sold by GlaxoSmithKline (GSK). LivaNova is a long-established company founded in 1989; GSK first offered the drug in 2002. But in 2006, GSK acquired a second company that held a patent on the drug — a drug that was marketed under the name Glivec. The US Food and Drug Administration approves Glivec for the treatment of chronic myeloid leukemia (CML), but imatinib mesylate
